                delta += 2;
            }
        }
    }
}
```

# Symmetric vs Asymmetric Cryptosystems

## Examples of symmetric crypto:

- ▶ classical ciphers (caesar, vigenere)
- ▶ block ciphers (DES, AES)
- ▶ stream ciphers (OTP, RC4, Salsa20)
- ▶ hash functions (MD5, SHA256)
- ▶ MACs (HMAC, Poly1305)

## Examples of asymmetric crypto:

- ▶ key exchange (Diffie-Hellman)
- ▶ encryption (RSA, ElGamal)
- ▶ signatures (RSA, DSA, Schnorr)
- ▶ homomorphic encryption (Paillier, RSA, Gentry)

```
static int probable_prime(BIGNUM *rnd, int bits) {
    int i;
    uint16_t mods[NUMPRIMES];
    BN_ULONG delta;
    BN_ULONG maxdelta = BN_MASK2 - primes[NUMPRIMES - 1];
    char is_single_word = bits <= BN_BITS2;

again:
    if (!BN_rand(rnd, bits, BN_RAND_TOP_TWO, BN_RAND_BOTTOM_ODD)) {
        return 0;
    }

    /* we now have a random number 'rnd' to test. */
    for (i = 1; i < NUMPRIMES; i++) {
        BN_ULONG mod = BN_mod_word(rnd, (BN_ULONG)primes[i]);
        if (mod == (BN_ULONG)-1) {
            return 0;
        }
        mods[i] = (uint16_t)mod;
        /* if bits is so small that it fits into a single word then we
         * additionally don't want to exceed that many bits. */
        if ((i <= 1) || (bits < BN_BITS2)) {

            }
        }
    }
}
```

# What is the significance of RSA?

- ▶ Historically the first asymmetric cryptosystem (published in 1977)
- ▶ Named for its inventors: Rivest, Shamir, Adleman
- ▶ Very flexible: can be used for both encryption and signing, is multiplicatively homomorphic
- ▶ Easy to implement
- ▶ Easy to mess up implementing, on account of its flexibility

```
static int probable_prime(BIGNUM *rnd, int bits) {
    int i;

# Modular congruence and primes

Divides cleanly/Is divisor of:

- ▶  $\text{divides}(x, y) \leftrightarrow \text{rem}(y, x) = 0$
- ▶ e.g.  $\text{divides}(5, 10)$ , since  $10 \% 5 == 0$

Modular congruence:

- ▶  $x \equiv y \pmod{n} \leftrightarrow \text{divides}(x - y, n)$
- ▶  $x \equiv y \pmod{n} \leftrightarrow \text{rem}(x, n) = \text{rem}(y, n)$

Primeness:

- ▶  $\text{prime}(p) \leftrightarrow \forall k \in [2, p-1](\neg \text{divides}(k, p))$
- ▶ `def prime(p):`  
    `return all([p % k != 0 for k in range(2,p)])`

`assert filter(prime, range(2, 20)) == [2, 3, 5, 7, 11, 13, 17, 19]`

Greatest Common Divisor:

- ▶  $\text{gcd}(x, y) = \max\{k | \text{divides}(k, x) \wedge \text{divides}(k, y)\}$
- ▶ `def gcd(x, y):`  
    `return max([1]+[k for k in range(1, x*y) if x % k == 0 and y % k == 0])`

# Fundamental Theorem of Arithmetic

- ▶ Any integer can be decomposed (uniquely) into a product of prime powers
- ▶  $\forall n \exists \vec{v} (n = \prod_{i=1}^{\text{len}(\vec{v})} p_i^{v_i})$
- ▶ e.g. for  $n = 84 = 2 * 42 = 2^2 * 21 = 2^2 * 3 * 7$ ,  $\vec{v} = [2, 1, 0, 1]$
- ▶ Computing  $\vec{v}$  from  $n$  is expensive (algorithms like GNFS and ECM find  $\vec{v}$  slower than polytime in the bitlength of  $n$ )
- ▶ Computing  $n$  from  $\vec{v}$  is fast ( $p_i$  can be found via sieving, and multiplication is cheap)
- ▶ When coding, a sparse representation of the prime vector is more convenient:

```

histogram = lambda s: (lambda d: [d.__setitem__(c, d.get(c, 0)+1) for c in s], d)[-1])(dict())
